

ReCaptcha

This module allows you to add a Google ReCaptcha on your registration and contact forms to protect you from spam.

Installation

1. After the standard installation, you must define your public and private Google ReCaptcha keys. To do this, you must create an account and register your site on the [Google ReCaptcha configuration page](#). It takes some time for your keys to be activated by Google, the module will not be activated until then.

2. In the module configuration, you can choose whether you want the recaptcha to appear on your registration and contact pages.

3. For Prestashop 1.4, 1.5 and 1.6

- add the following line to where you want to see the captcha in */themes/votre-theme/contact-form.tpl*

```
{if isset($HOOK_CONTACT_FORM_BOTTOM)}{$HOOK_CONTACT_FORM_BOTTOM}{/if}
```

4. For Prestashop 1.7

- add the following line to where you want to see the captcha in */themes/your_theme/modules/contactform/views/templates/widget/contactform.tpl*

```
{if isset($HOOK_CONTACT_FORM_BOTTOM)}{$HOOK_CONTACT_FORM_BOTTOM nofilter}
```

```
{/if}
```

- add the following line to where you want to see the captcha in */themes/yourtheme/templates/customer/partials/customer-form.tpl*

```
{hook h='displayCustomerAccountForm'}
```

- copy the file */modules/recaptcha/override/modules/contactform/contactform.php* to */override/modules/contactform/contactform.php*. Create the path if necessary. If the file exists, a developer will have to merge the code.

5. If you use Prestashop cache management:

- Go to the Administration> Advanced Settings> Performances
- Select "Force compilation on every call"
- Set "Cache" to "Off"
- Save
- Clear your browser cache or open a private browsing session
- Refresh the contact page to re-generate the cache
- You can then restore the previous configuration
